Alphanumeric data input method for mobile telephone, involves displaying text corresponding to matching keystroke sequence identified from dictionary, on electronic device display

Alerting Abstract...NOVELTY - A dictionary having stored **keystroke sequences respectively corresponding to text associated with an electronic device operation mode, is selected. A matching keystroke sequence is identified from the dictionary, on comparing keystrokes for a keystroke sequence with the stored keystroke sequences. Text corresponding to the matching keystroke sequence is then displayed on an electronic device display...**USE - For inputting alphanumeric data on portable electronic devices such as mobile telephone, personal digital assistant (PDA), pager, computer system, etc.

...**ADVANTAGE** - Enables a user to enter only one **keystroke per letter of the desired text, such that a matching keystroke sequence is identified from the dictionary and the related text is then displayed, hence the user is enabled to enter a desired text with reduced**

...**DESCRIPTION OF DRAWINGS** - The figure shows the front view of **portable electronic device with reduced keyboard system**
Original Publication Data by Authority

Claims:

...selecting a dictionary associated with the mode of operation of the electronic device, wherein the dictionary includes stored **keystroke sequences respectively corresponding to text associated with the mode of operation; comparing the keystrokes for the keystroke sequence with the stored keystroke sequences in the dictionary; identifying at least one matching keystroke sequence from the dictionary; and displaying the text corresponding to the at least one matching keystroke sequence on a display of the electronic device as a textual representation associated with the keystroke sequence.**

...new version. Once the two sorted lists (55 and 57) are created, they are recursively **compared one word (W)**, a group of elements (S), at a time to search for a **match** of data. Upon finding a match of data, the first and second sorted lists are...

...sequence of coinciding elements preceding and succeeding the match of data. Each sequence of coinciding **words** is then **stored** in a coincidences list (60). The coincidences list is processed to remove duplicative information and...

...location in the new version. Once the two sorted lists are created, they are recursively **compared one word** (a group of elements) at a time to search for a **match** of data. Upon finding a **match** of data, the first and second sorted lists are searched to find the largest sequence...

...information and a patch file is created. Several patch files may then be aggregated into a secure, **portable** compressed archive to decrease the storage and transfer requirements of the patch file. The compressed...

...of a series of elements. Several patch files may then be aggregated into a secure, **portable compressed** archive to decrease the storage and transfer requirements of the patch file. The compressed archive...

Claims:

...in the new version of data; recursively comparing the first and second sorted lists of **words one word** at a time for a **match of the words**; upon finding a **match** of the **words**, searching the **first** and second sorted lists of **words** again to **find** the largest sequence of coinciding elements preceding and **succeeding the match** of **words**; storing the largest sequence of coinciding elements in a **coincidences** list;

processing the coincidences list to remove duplicative coincidences,
creating a refined list of coincidences;sorting the...

...comparing the first and second sorted lists of words one word at a time
for a **match** of the **words** ;upon finding a **match** of the **words** ,
searching the first and second sorted lists of words again to find the
largest sequence of coinciding elements preceding and succeeding the **match**
of **words** ;storing the largest sequence of coinciding elements in a
coincidences list; processing the coincidences list to remove
duplicative **coincidences** , creating a **refined** list of
coincidences;sorting the refined list of coincidences by pointer in the new
version data, creating a sorted list of coincidences; **adding** the **pointer**
of each coincidence in the new version data to the largest sequence of
coinciding elements...

...sorted coincidences list and the end block list; andcompressing the
patch file into a **secure** , **portable** compressed archive for distribution
...of words indicating the element's original location in the new version
of data;recursively **comparing** the first and second sorted lists of
words one word at a time for a **match** of the **words** ;upon finding a **match**
of the **words** , searching the first and second sorted lists of words again
to find the largest sequence of coinciding elements preceding and
succeeding the **match** of **words** ; **storing** the largest **sequence** of
coinciding elements in a coincidences list;processing the coincidences list
to remove duplicative coincidences, creating a refined list of
coincidences;sorting the refined list of coincidences by pointer in the
new version data, **creating** a sorted list of coincidences; **adding** the
pointer of each coincidence in the new version data to the largest
sequence of coinciding elements, creating an end block list;creating a
patch file from the sorted coincidences list and the end block list;
andcompressing the patch file into a...

Access control for portable computer, involves storing user provided sequence of non-alphanumeric keystrokes as graphical password and providing access when sequence of user entered keystrokes matches stored password

...NOVELTY - A recorded sequence of non-alphanumeric keystrokes e.g. FORWARD, BACK, SELECT, etc., provided by a user is stored as a graphical password. Access to computer is provided when sequence of non-alphanumeric keystrokes entered by a user matches the graphical password.

Original Publication Data by Authority

Original Abstracts:

A portable computing device or "information appliance" having terse user input (e.g., limit set of keys) is provided...

Claims:

...controlling access to the computing device, the method comprising: recording a user-provided sequence of key strokes from said non-alphanumeric keys, wherein said recording step includes: recording a user-provided sequence of keystrokes entered from a keypad including at least one input key selected from FORWARD, BACK, SELECT, and HOME input keys; storing the recorded sequence of key strokes as a graphical password, so that said graphical password itself comprises a sequence of non-alphanumeric key strokes from the set of input keys; upon request from a user for access to the computing device, prompting the user to enter the...

...and providing access to the computing device only if the user enters a sequence of key strokes which matches that of the sequence of key strokes stored as the graphical password.

1. A radio telephone comprising :</br> a Number Assignment Module (NAM) in which is stored a predetermined code at a predetermined location

...

...A **radio telephone** comprising: a Number Assignment Module (NAM) (9) in which is stored a predetermined code at a predetermined location; means for determining if the **predetermined** code is stored at the predetermined location (5); and replacing means responsive to the means...

...The **radio telephone** has a Number Assignment Module in which is stored a predetermined code at a predetermined...

...The predetermined code is replaced with identification data upon determination that the code is stored **in the** correct location...

...Pref., it is determined if a sequence of **key strokes** is indicative of the identification data. The accuracy of the **key stroke** sequence is determined. At least one check character is derived from the **key stroke** sequence and a check character is displayed on the **radio telephone**. A signal indicative of the check is **sent over** the air for verification.

...8. A method for storing identification data in a Number Assignment Module (NAM) for a **radio telephone** comprising the steps: storing a predetermined code at a predetermined location in the NAM; entering a sequence of **key strokes**; in response to the **entered sequence of keystrokes**, determining if the predetermined code is stored at the predetermined NAM location; and replacing the predetermined code with **entered radio telephone** identification data conditional on the result of the determination such that the predetermined code is replaced only if it is **determined that the predetermined code is stored at the predetermined location, the entered sequence of keystrokes** including the **entered radio telephone** identification data.

Alerting Abstract ...The access control system has protected systems and corresponding **portable password issuing devices** that generate new authentic passwords by successively encrypting a **stored password** with a **selected sequence** of predefined encryption steps. The protected system generates and displays one or more random digits...

...to encrypting a stored previous password value with encryption steps corresponding to the user's **keystrokes** , and displaying a new password on its display. The user submits his purported new password...

Original Publication Data by Authority

Original Abstracts:

An access control system is disclosed in which protected systems and corresponding **portable** password issuing **devices** **both** generate new **authentic** passwords by successively encrypting a **stored** password with a **selected** **sequence** of predefined **encryption** **steps** . The protected system generates and displays one or more random digits, selects an encryption sequence...

...to encrypting a stored previous password value with encryption steps corresponding to the user's **keystrokes** , and displaying a **new** password on its display. The user submits his purported new password to the protected system...

...ABSTRACT A1

A mobile phone having a display; a keypad having a plurality of keys associated with several letters each...

...the operation of the keypad; a selectable predictive editor program for generating an output containing **words matching** a received string of ambiguous **key strokes**, the predictive editor program has a number of associated vocabularies including at least one language dependent dictionary and at least one dictionary receiving user defined inputs.

The **mobile phone** has an editor application controlled by the processor means for editing a text based on...

...SPECIFICATION text string.

OBJECT OF THE INVENTION

An object of the invention is to provide a **mobile phone** with a predictive editing program allowing more flexible text editing. This object is achieved by providing a **mobile phone** having a display, a keypad having a plurality of keys associated with several letters each...

...with the operation of the keypad, a predictive editor program for generating an output containing **word matching** a received string of ambiguous **key strokes**, an editor application controlled by the processor means for editing a text based on the...

...CLAIMS A1

1. A **mobile phone** having:

- * a display;
- * a keypad having a plurality of keys associated with several letters each...

...accordance with the operation of the keypad;

- * a predictive editor program for generating an output containing **word matching** a received string of ambiguous **key strokes**;
- * an editor application controlled by the processor means for editing a text based on the...

...CLAIMS B1

1. A **mobile phone** (1) having: * a display (3);

- * a keypad (2) having a plurality of keys (7) associated...

...the keypad (2);

- * a predictive editor program (42) adapted for generating an output containing a **word matching** a received string of ambiguous **key strokes**;

- * an editor application controlled by the processor means (18) adapted for editing a text based...

Detailed Description

Detailed Description

... a

predictive editor application for entering text. Such a terminal can be a cellular or **cordless phone**, a **personal digital assistant (PDA)** or a communicator. The editor is used for editing text for message handling, phonebook editing and searching, etc. The invention further relates to a method of compressing data in a **mobile terminal** comprising the steps in which a language dependent dictionary is stored.

BACKGROUND ART

EP 1031913 discloses a **mobile terminal** having processor means controlling the display in accordance with the operation of the keypad. A selectable predictive editor program generates an output containing **words matching** a received string of ambiguous **key strokes**. The predictive editor program has a number of associated vocabularies including at least one language...

...and

a dictionary receiving user defined inputs.
Language depended dictionaries such as stored in the **mobile terminal** known from EP 1031913 needs to contain sufficient words to be able to handle the...

SPECIFICATION

Technical Field

This invention relates to a speech recognition unit and method, for automatically **determining the sequence or series of a word** corresponding to an **input** audio signal, particularly, a speech recognition unit and method for finding the sequence of a word to be a recognition result at a high speed, and a navigation unit, a **portable telephone** unit and an information processing device which use the speech recognition.

Background Art

Conventionally, a speech recognition technique for automatically **determining the sequence of a word** corresponding to an **input** audio signal has been provided.

Such speech recognition technique is used for enabling search through

-- T9 Makes it Easy to **Input Text** for Wireless Short Messaging
Services Applications From Fujitsu **Wireless Telephones** --

Tegic Communications today announced it has signed a licensing
agreement with Fujitsu Network Communications.

The deal allows Fujitsu to incorporate T9(TM) intelligent **text**
input into its newest CDMA phones, the Personna(TM) **Series**.

Fujitsu **selected** Tegic Communications' technology because it makes
text entry from a **wireless phone** quick and easy. "T9 unlocks the power
of a **wireless phone** keypad, making it easy to **input words** and
entire sentences," said Manijeh Moghis, senior director and business
manager of Fujitsu's Wireless...

...Fujitsu's CDMA phones will be able to take advantage of an array of
advanced **PCS** services."

Unveiled in August 1997, T9 employs an intelligent software protocol
enabling users to enter...

... you get manner. The desktop publishing portion, while not a replacement for PageMaker, offers multiple columns, text flowing around graphics, and style sheets.

Despite these features, Ami is not as powerful as some of today's word processors. (Samna describes it as an "executive word processor.") For more power, move up to Ami Professional (\$495). Samna is not only pitting Ami Professional against WordPerfect and Microsoft Word, it is incorporating a number of features that make the program the Swiss army knife of graphics-based word processors.

For example, to create simple line drawings, Ami Professional includes vector-based drawing functions with pattern fill options, so you can edit PIC (Lotus 1-2-3 file format) graphics quickly. In addition...

...ll be able to create simple bar, pie, column, and line charts without leaving the word processor. And if you need to use any of these features on a regular basis, Ami Professional will have its own macro language to record keystrokes as well

as invoke functions to create custom applications. The other major addition to this **word** processor will be scanning options to control direct image scans.

Unlike Ami, Ami Professional includes...

...DDE), the Windows feature that links data from multiple applications programs.

Samna leads the Windows **word** processing field, but faces competition from Beckman Associates' Myriad (\$250), which was scheduled for release...
